

# CDC.NET

Software

## Advantages

---

- ◆ Supports full constellation, multi-frequency network RTK services
- ◆ High precision and reliable service
- ◆ Modular software architecture for distributed processing enhances system efficiency under heavy loads
- ◆ Separated user interface and services ensure high system stability
- ◆ Compatibility with common receiver types and data formats, supporting various differential data broadcast formats
- ◆ Offers RTK and RTD differential data services of different levels to cater to various industry needs
- ◆ Grid-Based differential services manage high-concurrency access requests from mass users

---

CDC.NET is the CORS Server software, which can check information about all tracked satellites, collect raw observation data from connected stations, produce correction parameters. It is usually installed in a server PC with a static IP address. With this VRS software, system supervisors can control all receivers at the stations and entire network, for instance:

1. Log in to the server from remote locations
  2. Inspect the operation of the receivers and the network
  3. Change configurations, operating modes etc.
